

# Connect-Flash Guide

connect-flash is a middleware for Express.js used to store temporary messages in the session.

These messages are available for the next request only, then removed automatically.

Flash messages are commonly used after redirects, such as login success, invalid password, form errors, or logout confirmation.

How it works: A message is saved in the session using `req.flash(type, message)`. On the next page load, you read it using `req.flash(type)`.

## Example Setup

```
const express = require('express');
const session = require('express-session');
const flash = require('connect-flash');

app.use(session({
  secret: 'secret',
  resave: false,
  saveUninitialized: false
}));

app.use(flash());

app.get('/login', (req,res)=>{
  res.render('login', { message: req.flash('error') });
});

app.post('/login', (req,res)=>{
  req.flash('error', 'Invalid credentials');
  res.redirect('/login');
});
```

Requirements: connect-flash depends on express-session because messages are stored in the session.

Common Message Types: success, error, info, warning.

Use Cases: Authentication flows, form validation, profile updates, password reset notifications.

Summary: connect-flash helps show one-time notifications after redirects in Express apps.
